

Victor Danger Valentine

Senior Software Developer

victor@dangervalentine.com Minneapolis, MN dangervalentine.com  [dangervalentine](#)  [dangervalentine](#)

Senior full-stack and mobile engineer with nine years building production systems end to end: .NET and Node.js backends across four SQL engines, React, Angular and Next.js web clients, and React Native and .NET MAUI applications shipped to the App Store and Google Play. Equally at home owning a client engagement from requirements through deployment and architecting a system from the first commit.

EXPERIENCE

Creed Interactive - creedinteractive.com

July 2021 - Present

Senior Software Developer Minneapolis, MN

One of two senior developers on the team, owning client engagements end to end in a digital agency while remaining roughly 90% hands-on.

- Own engagements from first client conversation through deployment: requirements gathering, solution design, effort estimation, and translation of an hour budget into a deliverable schedule up to a year ahead.
- Shipped iOS applications to the App Store for agency clients, owned the process from development through the store publication process, across .NET MAUI and Expo / React Native.
- Designed a daily ETL pipeline linking multi-file XML exports into a relational model of roughly 20,000 products and 4.4M+ related records covering imagery, video, specifications and pricing, with checksum-based change detection so unchanged entities are never rewritten.
- Cut catalog refresh downtime to under one second using SQL Server partition switching across production, staging and backup table triples, re-validating constraints after each swap and rolling back automatically when referential integrity fails.
- Replaced a 2012-era jQuery storefront with a headless WordPress content layer injected into .NET MVC Razor views through a custom shortcode rendering engine, letting non-technical stakeholders manage pages, events, promotions and store updates without developer time.
- Built and maintained internal dashboards, AWS deployments and traffic-monitoring tooling for an enterprise client across several years on a Node.js and Nest.js stack, with Sequelize and TypeORM over Oracle.
- Accountable for the output of junior developers; originated pull-request review policy, built and maintained CI/CD, and presented company-wide on emerging practice.

Mobile React Native · Expo · .NET MAUI

Web React · Angular · TypeScript · .NET MVC · Razor · WordPress · Drupal

Backend .NET Core · C# · Entity Framework Core · Nest.js · Node.js · PHP · Sequelize · TypeORM

Data Oracle · SQL Server · PostgreSQL · MySQL

Platform Azure · AWS · CI/CD

Intertech - intertech.com

February 2021 - October 2021

Senior Software Developer Eagan, MN

Consulting engagement, concluding concurrently with the start of the Creed Interactive role.

- Delivered search functionality and database support in a multi-tenant environment.

Software Developer I → II Lakeville, MN

Clinical and billing software for emergency medical services, in a regulated data environment, across a product line whose front ends spanned the whole evolution from vanilla JavaScript to modern Angular.

- Built the offline-first sync layer for a field application used by EMS providers on thousands of iPads, each holding 100,000+ records locally: patient data, procedure tracking and SNOMED / ICD-9 reference sets persisted in IndexedDB and reconciled on reconnect, so crews kept working through the long stretches without connectivity that the job actually involves.
- Built a merge-field document editor on contenteditable: a WYSIWYG authoring surface over hundreds of bindable fields spanning patient data, procedures, treatments and diagnoses, resolved at render time. Used daily by medical billers for invoices, EOB documents and PDF generation, and built before the libraries that would now make any part of it routine.

Backend .NET · C# · SQL Server · SOAP/XML**Frontend** JavaScript · jQuery · Knockout.js · AngularJS · Angular · React · TypeScript · IndexedDB**Platform** Azure · TeamCity

INDEPENDENT PRODUCTS

NextQuest - nextquest.dev

iOS · Android · In production

A game tracker for web and mobile: every replay, every platform, every verdict.

- Nightly ETL ingesting a third-party catalog of roughly 120 entity types via binary COPY into a staging schema, with zero-downtime Elasticsearch reindexing by verified alias swap.
- Offline-first mobile architecture on SQLite with timestamp-cursor delta sync and deletion reconciliation, so the app works fully offline and converges on reconnect.
- Typeahead search across 400,000+ titles as a graduated relevance ladder over eight facet dimensions.

Density Fitness - density.dangervalentine.com

iOS · Android · In production

Strength-training software that prescribes every session: weight, sets, reps and rest.

- Seven-package TypeScript monorepo in which web and React Native clients share the entire domain layer (progression engine, analytics, editor store) rather than merely utilities, with platform dependencies entering through a single injected seam.
- Pure-functional progression engine implementing 5/3/1, StrongLifts, linear, percentage-based and auto-regulated schemes, with a fold-on-write model that deterministically replays derived history when an earlier session is edited.

EDUCATION

Saint Cloud State University

2009 - 2014

B.A. in Communication Studies · Minors in Conflict Resolution and Psychology

Self-taught for two years, then hired into six months of employer-funded full-stack training before entering the field.
